

Haitthem Mohamed -- Task 1.2 (Standard numeric format)

C# Standard Numeric Format

```
int X = 10;
```

```
int Y = 20;
```

```
Console.WriteLine($"Equation: {X} + {Y} = {X + Y:C}");
```

1. why the output of this Equation = \$30.00?

Because:

- $X = 10$, $Y = 20$
- $\therefore X + Y = 30$
- **C** means **Currency Format** in **C#**.

Currency means money, so C# displays the number as money.

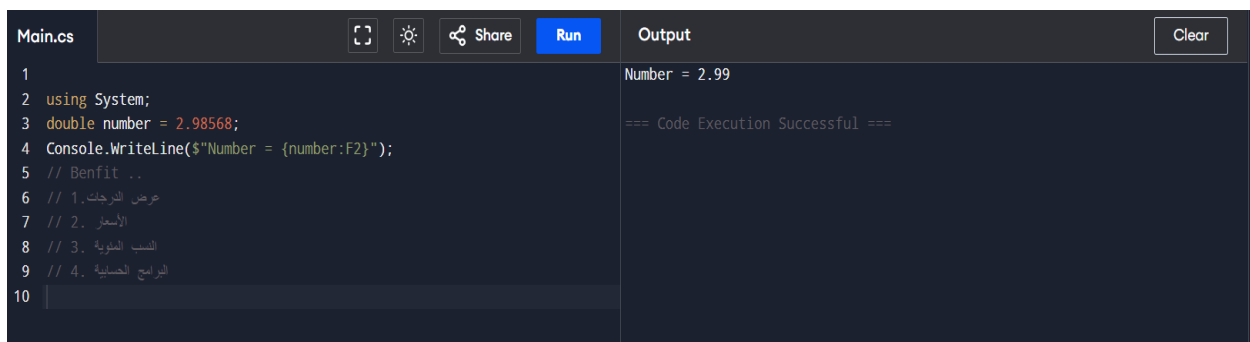

$\therefore$ Equation: $10 + 20 = \$30.00$

2. what is its benefit?

The benefit of numeric format specifiers is making numbers easier to read.

- Shopping programs
 - Bank systems
-

3. try another example with a different specifier with a screenshot of the output.

The screenshot shows a code editor with a file named 'Main.cs'. The code is as follows:

```
1
2 using System;
3 double number = 2.98568;
4 Console.WriteLine($"Number = {number:F2}");
5 // Benefit ..
6 // عرض الـ 1.
7 // الأسعار.
8 // النسب المئوية.
9 // الـ 4.
10
```

The output window on the right shows the result of the code execution:

```
Number = 2.99
=== Code Execution Successful ===
```
